OC Core 1.3.2 Journal Core

Release-Bound Scientific Kernel for Collapse, Residue, Rebirth, and Evidence-Scoped Continuity

Alexander Yashin

Version v1.3.2; release date: 28.04.2026

Abstract

This journal-core artifact states the compact scientific kernel of OC Core 1.3.2. It is not a replacement for the master monograph; it is the release-bound article spine that a reviewer can read first. The central result is a source-audited grammar for collapse, residue, and rebirth of continua, together with explicit evidence boundaries for theorem-native, operational, simulation, and frontier claims. OC Core 1.3.2 includes the terminal release-blocker ledger, K0–K12 projection state, DRT strict-salvage state, Tsukrov repair, Parfitian Cerberus pass, LRGEF release state, and night-delta integration as bounded public-safe release artifacts.

Release Identity

OC Core 1.3.2 is the current stable no-send baseline of the Core 1.3 line. It is prepared for owner review and package audit, not for automatic public publication. Public release, DOI minting, Zenodo upload, GitHub release creation, and outbound announcements remain locked until explicit owner approval and publication-gate review.

Scientific Kernel

The release kernel has four load-bearing notions:

- admissible realization: a state or fiber region that keeps a continuum live under its declared threshold and embedding regime;
- collapse/death: the loss of every admissible realization under that regime;
- residue: post-collapse structure that may remain without preserving live identity;
- rebirth: a later live continuum grounded in residue but not identical with the original continuum.

The defended classification claim is therefore bounded: within the audited OC Core kernel, when a continuum loses every admissible realization, the original continuum is dead; surviving structure is residue, and later residue-grounded life is rebirth rather than persistence of the original continuum.

Evidence Boundary

OC Core 1.3.2 separates claim support into release-visible classes. The master monograph carries theorem-roadmap references and proof-machinery anchors; the release packet carries evidence ledgers, replay manifests, domain projection state, and reviewer-navigation materials. The package does not claim unrestricted prediction, full replacement of domain science, or completion of every possible extension theorem.

Release-Integrated Science

Surface	Role in 1.3.2
Master monograph	Canonical theory, definitions, theorem roadmap, proof machinery, and evidence boundaries.
Science blocker closure ledger	Release terminality ledger for the eighty-two tracked release blockers; it records proof/evidence, replay, and owner-gate terminal routes without treating mere administrative notes as science.
K0–K12 projection state	Domain projection/replay status across mathematics, physics, chemistry, biology, systems/civilizational projection, and metaontology.
DRT strict salvage	Strict-salvage status: DRT-derived material is not promoted into Core authority without reproducibility and Core-gate reconciliation.
Tsukrov repair	Evidence-first response surface for the Stanislav Tsukrov review packet, using bounded public summaries and release-safe references.
Parfitian Cerberus	Ethical and release-governance audit layer for no-send release readiness.
LRGEF	Release governance, manifest, provenance, ZIP integrity, version consistency, and no-send publication lock.

What This Article Does Not Claim

This article does not assert that all future OC 1.4 race-hardening work is complete. It does not include private IP material, private reviewer-source material, private model transcripts, account credentials, local filesystem paths, or draft-only internal research. It does not use unsupported theorem labels or unsupported prediction language. Quantitative claims require protocol, code, data or fixture, output hash, tolerance envelope, and falsifier.

Reviewer Reading Order

A reviewer should start with this journal core, then read the master monograph front matter and theorem roadmap, then inspect the release dossier, PDF quality report, science blocker closure ledger, K0–K12 projection packet, DRT strict-salvage packet, Tsukrov repair packet, and Parfit/LRGEF gate reports. That reading order keeps the scientific claim, the evidence route, and the publication lock visible at the same time.
