

OC Core 1.3.3 Reviewer Attack and Response Map

OC Core 1.3.3: Reviewer Attack and Response Map

Status: OWNER_REVIEW_READY_NO_SEND.

No public release or journal submission is authorized.

Purpose: map hostile objections to exact artifacts, closure evidence, and remaining claim boundaries.

Primary attack classes: theorem theater, raw-discreteness leakage, unsupported liveness, fake metric boundaries, smooth-operator overreach, identity/rebirth equivocation, K-level collapse, empirical replay theater, novelty equivalence, and unsupported public-surface claims.

Closure rule: a finding closes only by theorem ID, finite case ID, replay output, comparator row, or corrected claim boundary; status tokens alone do not close a finding.

Current Cerberus boundary: critical_open_total=0 and high_open_total=0 for the bounded external-review package, while universal-completion and global-superiority obligations stay in the background research program.

Release boundary: OC Core 1.3.3 is an external-review no-send package for the bounded model core, not a public release and not an unbounded universal-completion claim.

Authorization: publish_allowed=false, journal_submissions_allowed=false, owner_approved=false, owner approval remains required.

Formal foundation: typed carriers, realizations, lawful possibility, time-sliced liveness, residue, morphisms, generalized boundaries, hybrid operators, cycle modes, historical/effective dimension, and an axiomatized k.

Lean evidence: formal/lean/OC133V12.lean is built by lake build OC133V12 and bound by formal/lean/LEAN_BUILD_CERTIFICATE_1_3_3.json.

Finite semantic evidence: proofs/finite_model_checks/run_finite_model_checks.py computes verdicts from raw model facts and writes proofs/FINITE_MODEL_CHECKS_1_3_3.json.

Proof boundary: promoted formal claims must cite theorem IDs, proof sheets, finite case IDs, or corrected claim boundaries.

K-level evidence: data/k_level_irreducibility_matrix.json binds adjacent transitions to retained witnesses and lawful demotion controls.

Empirical boundary: official snapshots are inputs and replay QA, not domain validation by themselves.

Target-blind scope: validation/target_blind/OC133_TARGET_BLIND_PREDICTION_TABLE.json supports bounded reconstruction rows only.

No overclaim rule: unbounded universal-completion, global superiority, and full-domain numerical closure remain background research obligations unless literal evidence supports promotion.

Review evidence: reviews/oc133_llm_cerberus/ contains the structured Cerberus suite and the critical/high open-count summary.

Adversarial evidence: simulations/adversarial/run_all.py and

falsification/counterexample_search/run_counterexample_search.py exercise the known attack classes.

Package evidence:

releases/oc_core_1_3_3/submission_packages/SUBMISSION_PACKAGE_INDEX.json lists eight owner-review-ready no-send venue packages.

Reproducibility evidence:

reports/OC_CORE_1_3_3_POST_GENERATION_REPRODUCIBILITY_MANIFEST.json binds regenerated artifacts and clean-checkout replay status.

Reader route: start with claim ledger, theorem inventory, finite checks, validation report, Cerberus summary, and then the venue package for the target journal.
