

OC Core 1.3.1 Unignorable Spine

Central route

- Boundary-cycle-collapse invariant: Across bounded domains, rising threshold stress shrinks boundary clearance, degrades cycle integrity, worsens destructive flow ratio, and increases collapse risk in a structured non-metaphorical way.
- Physics threshold replay: Bounded physics threshold and transport claims admit replay packets against public data with declared baselines and explicit falsifiers.
- RAF closure packet: Prebiotic closure and reaction-network continuity can be defended as a bounded structural packet through explicit RAF closure simulations and chemistry data routes.
- Membrane viability windows: Membrane-threshold viability packets can be reproduced as bounded simulation-backed biological continuity claims without overclaiming intervention or control.
- K6 binding collapse laws: K6 binding and prediction-error collapse remain lawful as bounded formula packages with explicit non-claims rather than uncontrolled empirical neuroscience claims.

Boundaries

- No toy-only simulation is cited as validation.
- No comparator-defeated claim survives in the positive core.
- Resource-limited claims are demoted to bounded frontier or future-resource status.

Reader route

Use the killer claim index, reproducibility notes, and simulation run-all path to inspect the central route quickly.
